- 3.
4. [Supabase](#) - Managed Postgres Database - with built in authentication, storage and functions
5. [FastAPI](#) - Python based backend framework
6. [NextJS](#) - Javascript based Front End framework
7. [Compound Engineering](#) - Claude Code plugin to do complex engineering tasks really well.

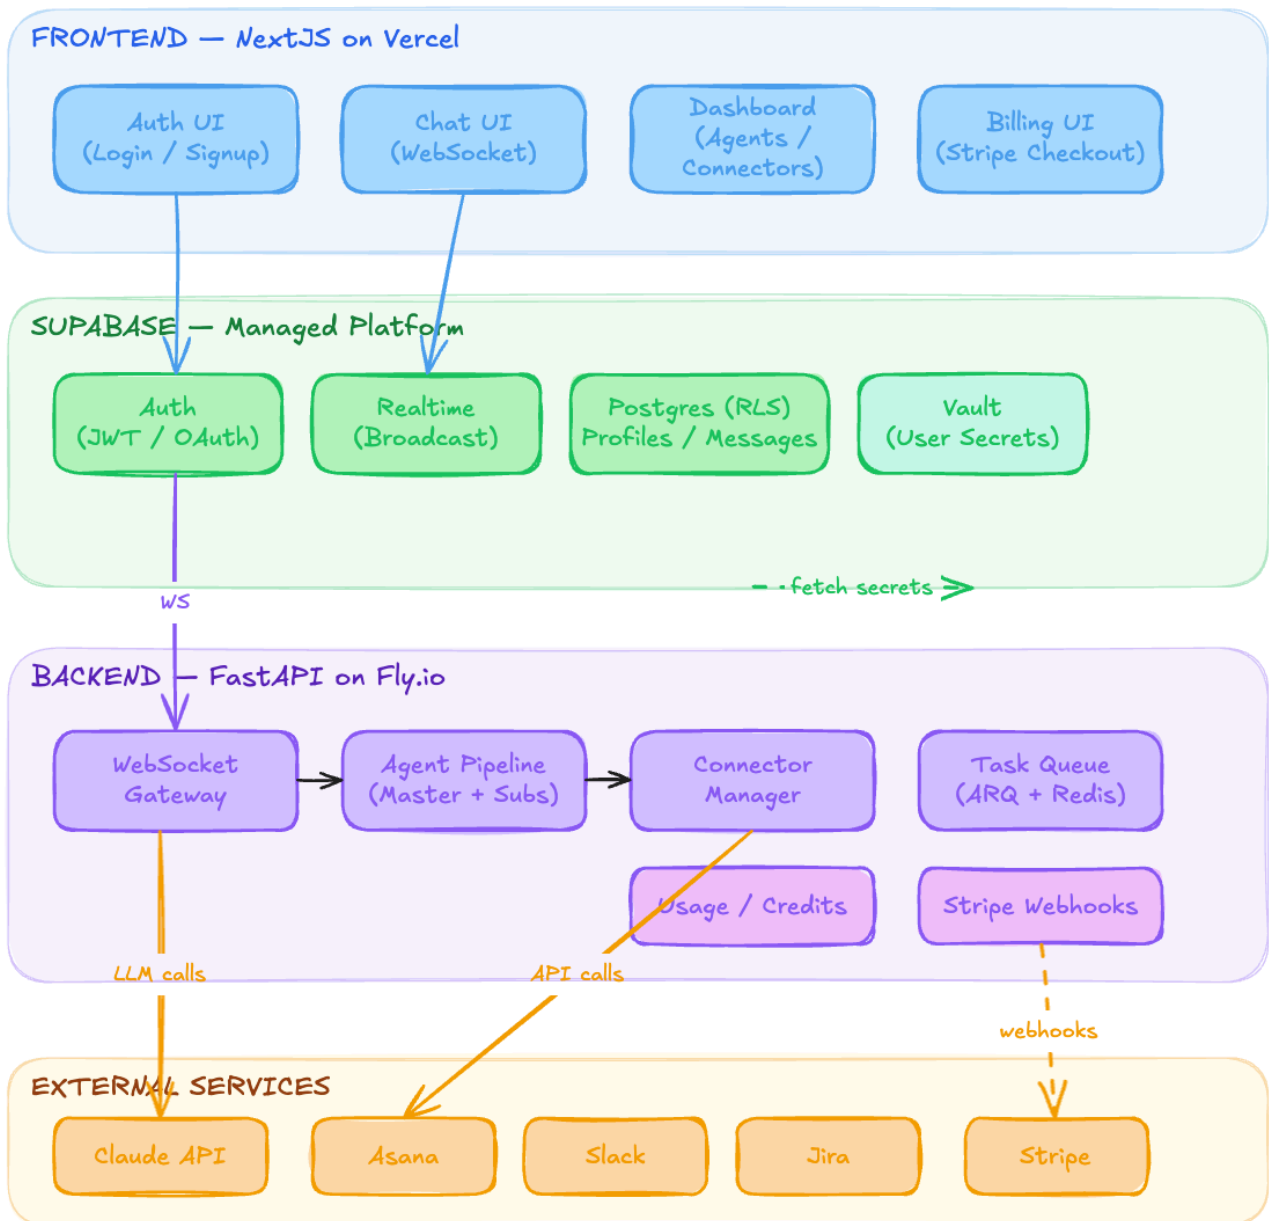

Prompt

In this repo, we have a simple agent and subagent system to operate as customer service and content marketing agents for a company. However, we want to turn this into a product that 100s of users will use. That means, users will be able to talk to the master agent, setup authentication keys to their own asana project(among other connectors) and use those subagents to get their job done. Come up with an engineering plan that will be used by a team of claude code agents to implement this end to end. We have a few preferences - we want to use Supabase for auth and DB, we want to use nextJS for the front end and FastAPI in Python for the backend. Ask any questions you want to clarify intent before starting. For this task and all the tasks that follow, write down primary artifacts into the folder. For example, for this task, write the plan down in a file.
